

Method and System for Decision Support Analysis

ABSTRACT OF THE DISCLOSURE

5 The present invention provides techniques for managing and analyzing
business information. Specific embodiments provide models that enable persons with
business or other non-technical fields understand and manipulate relationships between
various data entities in databases, for example. Various applications are supported by
specific embodiments. Multidimensional models, statistical computations, rule based
10 systems, report generators, and the like can be used with various specific embodiments in
order to enable the decision maker to understand, analyze and present relationships
among various information entities.
